

## **F-2014-00001 - IVF/ICSI and DI success rates for female patients compared by gender of the patients partner**

24 January 2014

### **Summary of request**

The Authority was asked for IVF/ICSI success rates for female patients registered with females partners compared with the same data for patients registered with male partner, broken down by CaFC age groups.

### **HFEA response**

UK success rates of IVF/ICSI and of DI have been requested for female patients registered with female partners compared against the same data for patients registered with male partners. It has also been requested that this data is to be broken down by the age groups used on the Choose a Fertility Clinic of the HFEA website.

Please find this data in the attached documentation. Please note that we have included data for patients registered with female partners, patients registered with male partners and all other patients (patients who had treatment without a registered partner). This 'all other' group will include those patients in the 'patients with male partners' cohort but not those in the 'patients with female partners' group.

Please note that very small numbers have been replaced with a less than five figure. This is because there is a significant possibility that this information, when combined with other information that may be accessible, could lead to the identification of a person to whom the HFEA owes a duty of confidentiality. To disclose this information may therefore result in a breach of the confidentiality provisions of section 33A of the Human Fertilisation and Embryology Act 1990 (as amended). Rates are also not provided when the sample size of treatments is fewer than 50 as the HFEA does not feel that the rate accurately illustrate the situation in such cases.

The entirety of the data is included on one spreadsheet. The additional three spreadsheets contain the same information but are in a more open format should it be desired to reuse the data.
